

30Video Firmware Recovery

In a situation where the card firmware is preventing the system from booting, you may use the recovery pins located near the flash to inhibit the card's ROM during the boot process.

You may bridge these pins in any way that is convenient: install a header, use a bit of wire, tweezers, or a resistor less than 1Kohm – all work. It just needs to be temporary and able to be removed after the boot. **Please note system 5V is present on this header so don't touch the case with it.**

Process

1. Install the jumper/bridge
2. Power on the system
3. Once machine has booted, remove the jumper/bridge from the card.
4. Run firmware update and write new firmware to the card
5. Reboot
